                                             The invention relates to double-stranded oligonucleotides consisting of two complementary strands (Ia; Ib), each having 1-5 unpaired nucleotides, at either at their 3' and 5' ends, forming single-stranded overhangs. One of (Ia) and (Ib) is complementary to a target sequence, (DNA or RNA), that is to be specifically repressed. The oligonucleotides are preferably double stranded inhibitor RNA molecules with a couple of thymidine bases attached at the 3' or 5' ends. The targets are preferably nucleic acids that, when repressed, induce apoptosis, necrosis or differentiation of tumour cells and/or inhibit division of such cells. Typical of many specified targets include: genes of the BCL2 family, genes that encode
metalloproteases (matrix or membrane) or their inhibitors; genes encoding mutant forms of nuclear hormone receptors; a sequence encoding the Hifl-alpha transcription factor; sequences encoding various isoforms of the

Disclosure; Page 17; 148pp; French.

CC double stranded inhibitor RNA molecules with a couple of thymidine bases CC attached at the 3' or 5' ends. The targets are preferably nucleic acids CC that, when represed, induce apoptosis, necrosis or differentiation of CC thmour cells and/or inhibit division of such cells. Typical of many CC specified targets include: genes of the BCL2 family; genes that encode CC metalloproteases (matrix or membrane) or their inhibitors; genes encoding mutant forms of nuclear hormone receptors; a sequence encoding the Hifl-CC alpha transcription factor; sequences encoding various isoforms of the CC vascular endothelial growth factor; viral genes, genes that express a CC mutated protein, e.g. inactive p53; genes that are formed by a CC chromosomal translocation, e.g. where associated with leukaemia, and CC genes that express androgen receptors. The oligonucleotides are used: (i) conditions caused by expression of a harmful gene or fusion protein, c.g. specifically cancer (e.g. associated with expression of mutant p53 or of CC the human papilloma virus B6 protein), viral infections, especially AIDS CC reancer-inducing viruses, or unconventional infections, especially AIDS CC and (ii) for treating hypervascular diseases, e.g. age-related macular degeneration, angiogenesis in tumours, diabetic retinopathy, psoriasis CC and rheumatoid arthritis. They may also be used in vitro, e.g. for treating transplants and for establishing a genetic profile, for conditional caused by expression of setable than either hybrids prepared from DNA or single-stranded CC immunological or intolerance represents the sequence in the effectively than plandids. This sequence represents the sequence in the effectively than plasmids. This sequence represents the sequence in wild type human p53 gene around the position of mutation R248W. The oligonucleotides of the invention can be targeted to this sequence. at either at their 3' and 5' ends, forming single-stranded overhangs. One of (Ia) and (Ib) is complementary to a target sequence, (DNA or RNA), that is to be specifically repressed. The oligonucleotides are preferably The invention returned (Ia, Ib), each naving incle-stranded two complementary strands (Ia, Ib), each naving incle-stranded (D) The invention relates to double-stranded oligonucleotides consisting of two complementary strands (Ia; Ib), each having 1-5 unpaired nucleotides,

                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one gene or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or a series of reagents, where the reagent or series of reagents, distinguishes between methylated and non methylated CpG dinucleotides within the target nucleic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PNA (peptide nucleic acid)-oligomers are useful as probes for determining cytosine methylation state or single nucleotide polymorphisms. The current sequence is that of the PCR primer of the properties with the courtes to the polymorphisms.

MAPK siNAs have cytostatic, anticidabetic, antinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antipacterial, antirheumatic, antipacriatic and gastrointestinal activities. The MAPK sinks can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide studying screening). The present sequence represents a MAPK sink which is used the property of the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is used to the sequence represents a map which is the sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunosuppressive; antibacterial; antirheumatic; antiarthritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour; inflammatory disease; asthma; septic shock; rheumatoid arthritis; psoriasis; inflammatory bowel disease; drug screening;

                              have cytostatic, anorectic, antidiabetic, antiinflammatory, antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity diabetes types and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is use in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mitogen-activated protein kinase; MAP kinase; MAPK; RAPK; RAM interference; mitogen-activated protein kinase; MAP kinase; MAPK; RAPK; RAM interference; cytostatic; anorectic; antidiabetic; antiinflammatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarchritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour;

```
sequences for enzymatic RNA molecules. The NA molecules are gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMs interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines. (Updated on 25-MAR-2003 to correct PN field.) The primers are made from oligo DNA fragments selected from specific hepatitis C virus subtypes. The primers can be used to in a one step PCR reaction which can determine the subtypes of a large number of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAQ94257, to amplify a region from nucleotides 1571 to 2009 of the SV40 large T antigen gene. A fragment of 429 by was generated. The fragment is used in the invention, a mouse hepatoma cell line which may metastasise specifically in the liver and contains an albumin promoter gene and a SV40-T gene. The cell line is useful for the production of animal models for the study of cancer and screening of anti-cancer agents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EXERNORXS
                                                                     CC Rapid and cost effective diagnosis of disease-associated mutations in the CC p53 gene is achieved by employing a selected number of diagnostic tools, CC in a hierarchy of increasing accuracy and cost per tool, in which each CC tool detects essentially no false positives. Tests that may be employed, CC in order of increasing accuracy and cost are: (a) immunoassays; (b) DNA CR fragment length/quantity analysis; and (c) DNA sequencing of regions CC most likely to harbour point mutations. AATO8645-66 are primers used in CC DNA fragment length/quantity analysis. The amplification of the eleven CC exons is advantageously carried out in 3 multiplex pools, the members of CC a pool selected because they all use the same hybridisation temperature CC and none of the expected fragment lengths will overlap in an CC electrophoresis gel. One of each pair of primers is labeled at the 5' end with an identifiable marker such as fluorescein, rhodamine or cyanine. The present sequence is used with AATO8654 to amplify a 247 bp fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                               Rapid and cost effective diagnosis of disease-associated mutations in the possible problem of participation of problem of participations in the present sequence is achieved by employing a selected number of diagnostic tools, in a hierarchy of increasing accuracy and cost per tool, in which each tool detects essentially no false positives. Tests that may be employed, in order of increasing accuracy and cost are: (a) immunoassays, (b) DNA fragment length/quantity analysis, and (c) DNA sequencing of regions most likely to harbour point mutations. Alamonation of the erven exons is advantageously carried out in 3 multiplex pools, the members of a pool selected because they all use the same hybridisation temperature and none of the expected fragment lengths will overlap in an electrophoresis gel. One of each pair of primers is labeled at the 5' end with an identifiable marker such as fluorescein, rhodamine or cyanine. The present sequence is used with AATO8651 to amplify a 268 bp fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

Nucleic acid sequence determinate extension products, which are in prime for mucleotide in nucleotide sequence represents a prime extension products, which are in prime for mucleotide in the region of inte sequence can be used in the meth companies combining the sample with the companies of inte produced, characterised in that region of inte produced, characterised in that companies combining the sample with the companies of inte produced, characterised in that companies of inte produced in that companies of interproduced in that produced in that produced in the produced in that p
                                                                                                                                                                                                                                                                                                                                               This sequence represents a primer for exon 6 of the p53 gene. This sequence can be used in the method of the invention for determining the position of at least one selected species of nucleotide, in a region of interest, in a target nucleic acid polymer, in a sample. The method comprises combining the sample with a reaction mixture to synthesise chain extension products indicative of the positions of the species of nucleotide in the region of interest and evaluating the products produced, characterised in that the sample, which is combined with the reaction mixture, and contains target and non-target nucleic acid reaction mixture, and contains target and non-target nucleic acid colymers in natural abundance. The method can be used to detect mutations, particularly mutations of medical significance, in samples derived from a human patient, animal, plant or microorganism, determine HLA type ancillary to transplant procedures, detect and identify microorganisms, particularly pathogenic microorganisms, in a sample and in in situ sequencing reactions to produce sequencing fragments in a contains of histological specimen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          interest, in a target nucleic acid polymer, in a sample. The method comprises combining the sample with a reaction mixture to synthesise chain extension products indicative of the positions of the species of nucleotide in the region of interest and evaluating the products produced, characterised in that the sample, which is combined with the reaction mixture, and contains target and non-target nucleic acid polymers in natural abundance. The method can be used to detect mutations, particularly mutations of medical significance, in samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid sequence determination - comprising synthesising chain extension products, which are indicative of positions of selected species of nucleotide in nucleotide sequence.

The DNA molecule was prepared by contacting DNA molecules having a region of random sequence with adenosine or ASP (preferably ATP), isolating a csubpopulation by partioning DNA molecules which specifically bind the adenosine or ASP, amplifying the subpopulation in vitro and repeating the process 4 times to obtain a single stranded DNA molecule capable of CC process 4 times to obtain a single stranded DNA molecule capable of CC binding adenosine or ASP, i.e. Systematic Evolution of Ligands by CC Exponential enrichment (SBLEX). Catalytic DNA produced using the method CC can be used as in vitro or in vivo catalysts, or to detect the presence of the ligand. They may also be used in assays to detect molecules complished by the DNA, which are not themselves ligands, e.g. DNA catalytic DNA molecule has significant advantages over ligand binding and catalytic RNA in terms of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

It was used with reverse primer mp262 (see AAT91101) to obtain an 800 bp RT-PCR product that constituted a 5' part of LAMAN cDNA. This was combined with a previously obtained PCR cDNA fragment (see AAT91096-97) to produce a full-length clone (see AAT91086) for LAMAN (see AAW26682). Mutations in

Analysing nucleic acid amplification reaction

containing sample - comprises performing multiplex and reacting amplified fragments in sequencing

This sequence represents a primer for exon 6 of the p53 gene. This sequence can be used in the method of the invention for analysing a nucleic acid containing sample. The method comprises performing a multiplex amplification reaction on the nucleic acids in the sample using amplification primer pairs, one pair for each region to be analysed, to produce a mixture of amplified fragments, and determining the sequence of

Analysing nucleic acid containing sample - comprises performing multiplex amplification reaction and reacting amplified fragments in sequencing

                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a primer for exon 5 of the p53 gene. This sequence can be used in the method of the invention for analysing a nucleic acid containing sample. The method comprises performing a multiplex amplification reaction on the nucleic acids in the sample using amplification primer pairs, one pair for each region to be analysed, to produce a mixture of amplified fragments, and determining the sequence of at least one species of amplified fragment, characterised in that the sequence is determined by combining the mixture of amplification of fragments with a sequencing reaction mixture for the production of sequencing fragments, and evaluating the sequencing fragments produced. The method can be used to analyse regions in the nucleic acids in the sample for the presence of mutations, or detect and type microorganisms. The method directly performs sequencing reactions on complex DNA mixtures
                                                                                                                                                                                                                                                                                                                                                                                          WO9741258-A1

The oligonuclectides which specifically hybridise to B7 modulate its expression (and thus T cell activation and proliferation). This is particularly useful for treatment and prevention of inflammation and autoimmune diseases, e.g. asthma, (juvenile) diabetes, myasthenia gravis, Grave's disease, rheumatoid arthritis, allograft rejection, psorilasis, (gystemic) lupus erythematosus, multiple sclerosis, contact dermatitis, rhinitis, allergy, cancer and metastases. The oligonucleotides may also be used to manipulate T cell activation ex vivo; to determine or detect B7 protein expression; for diagnosis; as assay and purification reagents, and to study physiological roles of B7 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           at least one species of amplified fragment, characterised in that the sequence is determined by combining the mixture of amplification fragments with a sequencing reaction mixture for the production of sequencing fragments, and evaluating the sequencing fragments produced. The method can be used to analyse regions in the nucleic acids in the sample for the presence of mutations, or detect and type microorganisms. The method directly performs sequencing reactions on complex DNA mixtures
                                                                                                                                                                                                                                                                                                     New oligo:nucleotide(s) that modulate expression of B7 proteins - used for, e.g. controlling activation and proliferation of T cells, particularly for treatment, diagnosis and prevention of inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO9829124-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                    CC sequences shown in AAV55996 to AAV56003 represent primers used for RT-PCR CC amplification during the course of the invention. The invention provides a method for identification of selective inhibitors of nitric oxide CC synthases (NOS) which comprises determining inhibition of activity of NOS in the presence of a candidate compound and two different concentrations of tetrahydrobiopterin (THB). Inhibitor of GTP cyclohydrolase 1-mediated synthesis of THB can be identified by contacting GTP cyclohydrolase 1 which a candidate compound and determining inhibition of the enzyme CC with a candidate compound and determining inhibition of the enzyme CC identified by the methods may be used in treatment of conditions in which the production of nitric oxide (NO) is implicated, such as septic shock, CC asthma, arthritis, inflammatory bowel disease, heart failure or acute systemic inflammation. The inhibitors may also be useful in treatment of neurological disease states in which neuronal NOS has been implicated, CC e.g. stroke, dementia or Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for measuring the resistance of p53 mutant cancer cells to the cytotoxic effects of chemotherapeutic agents by testing a sample comprising p53 mutant cells or an extract from p53 mutant cells for the abundance of cyclin protein D1. AAX9036 to AAX90373 represent reverse transcription PCR primers used to amplify the human p53 gene. The method can be used to predict the response of human cancer cells to anticancer therapy agents which can be used to select the most appropriate therapy for patients suffering from cancer. High cyclin D1 levels or high cyclin D1 expression together with p53 mutation is strongly associated with resistance to cis-diaminedichloroplatinum (CDDP)
                                                                                                                                                                                                                                                                                                                                   in human cancer cells. The test may be used to detect resistance to other cytotoxic agents such as etoposide and indicate whether radiation may be a viable alternative to CDDP or if other cytotoxic agents would be more suitable, e.g. may suggest that Taxol should be considered as an alternative therapy as it may not be sensitive to a combination of p53 mutation and cyclin D1 protein overexpression
                                                                                                                                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a PCR primer for DNA encoding the human 13 protein. The invention relates to an antisense compound of 8 t nucleobases in length, that inhibits the expression of the human 13. The antisense compound is useful for treating an animal, part humans, having or being prone to a disease or condition associate the expression of G-alpha-13, such as cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   products according to breed origin; (b) determining or testing the breed corigin of a product; or (c) validating an animal product. The method comprises analysing a sample of the product for the allele(s) of at least come breed-determinant (BD) gene. The present invention also describes: (1) methods for determining the coat colour genotype of a pig by come receptor (alpha-MSHR) gene; (ii) the anino acid sequence of an colour manner receptor (alpha-MSHR) gene; (ii) the anino acid sequence of an colour for the protein; (iii) detecting which microsatellites (or other linked comarker alleles), linked to the alpha-MSHR gene, or particular alleles of it, are present; and (iv) analysing nucleic acid to determine if the KIT gene carries a polymorphism associated with the Belt genotype. The main commanls, especially pigs. Particular applications are confirming stated corigin of meets; in quality control; for maintaining stock purity, and in coreding programmes (to confirm particular crosses). The method ce inexpensively. The process can be made quantitative. The present sequence conly very small samples and many samples can be screened quickly and convery control controls for maintaining stock purity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for the diagnosis of a cancerous or pre-cancerous state from the co-elevation of cyclin-dependent kinase 1 (CDK1) and CDK4 levels. The method may be used for the clinical diagnosis of cancerous or pre-cancerous cells. In addition the combination of targets may be used to screen for drugs that may specifically act on cancer cells. The combination of CDK1, CDK4 elevation and p53 mutation in combination form a complex target that is likely to be specific for cancerous cells. AAX90388 to AAX90401 represent reverse transcription PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human;
signal
                                        The present invention describes a method for the determination of sensitivity of cancer cells to anti-cancer agents by measuring the mutational status, expression and /or function of signal transduction factors. The method, by measuring the resistance of cells to anti-cancer agents, is useful for selecting the most appropriate therapy for patients suffering from cancer. AXY0374 to AXY0377 represent reverse transcription PCR primer for the human p543 gene, used in an example from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 20 BP; 2 A;

                                                                                                                                                                                                                                                                                                 This invention describes novel antisense oligonucleotides against thioredoxin and thioredoxin reductase gene which have cytostatic activity and are useful for inhibiting tumour growth and metastasis in mammals. They may also be used as hybridization probes to detect the presence of the thioredoxin and thioredoxin reductase mRNAs in mammalian cells. They may also be used as molecular weight markers. The antisense oligonucleotides are nuclease resistant due to the presence of phosphorothioate internucleotide linkages. AAZ00478-Z00503 represent oligonucleotide primers capable of binding to human thioredoxin mRNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a PCR primer that can be used in the method of the invention. The method is for genetic diagnosis using human mitochondrial DNA where there is at least one base replacement from among the following five replacements: the 3010th base is changed from guanine to adenine; the 4883rd base from cytosine to thymine; the 5178th base from cytosine to adenine; the 8414th base from cytosine to thymine; and the 1468th base from cytosine to thymine. The method can be used for diagnosing the probability of contracting adult diseases. A confirmation of base replacement can give a diagnosis of the level of probability of contraction of adult diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; Fas; Apo-1; antisense compound; Fas ligand; Fap-1; hepatitis; Fas associated protein 1; protein tyrosine phosphatase; cancer; autoimmune disease; inflammatory disease; lymphoma; phosphorothioate;

The specification describes antisense compounds which are targeted to the 5'-untranslated region, translational start site, translational termination region or 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense oligonucleotides for treating hepatitis and colon, livlung cancer are inhibitors of Fas, Fas ligand or Fas associated (Fap-1) expression.

New peptide nucleic acid (PNA) in mammalian cells is useful as mammalian telomerase.

(A) compounds that inhibit telomerase activity as probes to detect the RNA component of a

Example 1;

C01

29; 45pp;

The present sequence represents an antisense oligonucleotide used as control sequence alongside a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibit elomerase activity. Telomerase is a ribonucleoprotein enzyme

inhibits

```
CC affords greater resistance of degradation by proteases or nucleases. The CC therapeutic PNAs may be used for treating disease conditions such as CC cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human CC immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency conditions) and associated pathologies, fungal infections, and other CC syndrome) and associated pathologies, fungal infections, and other CC cytostatic agents, antifungal agents, and other cytotoxic or CC cytostatic agents, antifungal agents, and other cytotoxic or CC cytostatic agents, antifungal agents, and other cytotoxic or CC cytostatic agents. PNA probes are also used for forensic identification CC probes to detect or quantitate polynucleotides having a human telomerase CC RNA (hTR) sequence. PNA probes are also used for forensic identification CC fragment length polymorphism (RFLP) pattern. PNAs are also useful as CC probes to detect the RNA component of amammalian telomerase and as CC probes to detect the RNA component of amammalian telomerase and as CC probes to detect the RNA component of amammalian telomerase and conditions to be detected with increased confidence and CC possibly at an earlier stage, before cells are detected as cancerous CC based on pathological characteristics. The diagnostic and prognostic CC methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the CC cell expresses telomerase activity and its RNA component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PN backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC affords greater resistance of degradation by proteases or nucleases. The CC therapeutic PNAs may be used for treating disease conditions such as CC cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human CC immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency conditions) and associated pathologies, fungal infections, and other CC diseases characterized by abhormal telomere metabolism or telomerase activity, in combination with antineoplastic and other cytotoxic or CC used for molecular diagnostics, labelled PNAs are used as hybridization CC used for molecular diagnostics, labelled PNAs are used as hybridization CC used for molecular diagnostics, labelled PNAs are used as hybridization CC probes to detect or quantitate polymucleotides having a human telomerase CC RNA (hTR) sequence. PNA probes are also used for forensic identification CC fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as CC probes to detect the RNA component of a mammalian telomerase and as CC inhibitors of telomerase activity. The method of the present invention CC allows cancerous conditions to be detected with increased confidence and CC possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic CC methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the CC cell expresses telomerase activity and its RNA component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      synthesizes one strand of the telomeric DNA, using as a template an 11 mucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and
                                                                                                                                                                                                Human biallelic marker downstream amplification
                                                                                                                                                                                                                                                                                                         AAZ77376
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibit telomerase activity. Telomerase is a ribonucleoprotein enzyme that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 1; Col
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2000-292432/25

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical states of the characterisation of the pharmaceutical agents acting on a disease as well as other treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of using interferon-alpha5 or its coding sequence to prepare compositions for treatment of hepatic diseases, e.g. (i) chronic hepatitis C; (ii) cirrhosis of viral origin and (iii) hepatocellular carcinoma. The method restores the level of interferon-alpha5, which is reduced in diseased liver cells, to normal levels. The primers AAZ47036-Z47037 were used initially to detect the level of expression of beta-actin gene in liver tissue by PCR as a control for detecting the level of interferon-alpha or beta. The prime amplify a 314 bp fragment of the human beta-actin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAA66151 standard;
                                                                                                                New radiation hybrid map of the dog, Canine familiaris, for e.g. identifying genes implicated in phenotypic and or in genetic diseases and for studying dog pedigrees.
                                                                                                                                                                                                                                                                                                                                                                                Canis familiaris.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  09-OCT-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAA66151;
The present invention describes a radiation hybrid map of the dog (Canifamiliaris) genome comprising the genome location of a marker selected from AAA6613 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 of the dog genome and provides a dense map integrating different types
                                                                                                                                                                                                                                                                                           15-NOV-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating liver diseases with interferon-alphas it, particularly chronic hepatitis C.

                                                                                                               Sequence 20
                                                                                                                                                                                                                                                                                                                 Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes involved in genetic diseases
                                                                                                                                              dermatitis,
                                                                                                                                                        multiple sclerosis, psoriasis, systemic lupus erythematosus,
                                                                                                                                                                   the treatment of inflammatory and autoimmune disorders, including asthma juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease,
                                                                                                                                                                                                             The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in nucleotides are 2'-methoxyethoxy residues. The sequences can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WO200074687-A1
                                                                                                                                                                                                                                                                                         Example 14; Page 84; 162pp; English

Sequence
                                     nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthy juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, systemic lupus erythematosus, contact
                                                                                                                                                                                           Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nuclei acid sequence encoding B7 protein.
                                                                                                          The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequence. The antisense sequences have phosphorothicate backbones and some

The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other

The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of

a sequence of 6-25 mulleobases, that inhibit telomerase activity in ammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of telomerase and as inhibitors of telomerase activity, or to component (hTR) sequence, as well as in forensic identification of criminal component (hTR) sequence, as well as in forensic identification of criminal component (hTR) sequence, as well as in forensic identification of criminal component (hTR) sequence, as well as in forensic identification of criminal component (hTR) sequence, as well as in forensic identification of criminal component of unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, component inflammation, component inflammation, component inflammation, acquired diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, human immunodeficiency virus (HTV) infections, acquired component inflammation in telomerase component inflammation in telomerase component inflammatical pathologies, and other component inflammatical pathologies, and other component inflammation in telomerase component inflammation in telomerase component inflammation in telomerase of the properties of the inflammation in telomerase of the inflammatical pathologies.
